

DIVISION FOR AIR QUALITY

Kentucky Annual Ambient Air Monitoring Network Plan 2007

Commonwealth of Kentucky Environmental & Public Protection Cabinet
Department for Environmental Protection
Division for Air Quality
803 Schenkel Lane, Frankfort, Kentucky 40601

This is a publication of the Kentucky Division for Air Quality, part of the Department for Environmental Protection, Environmental and Public Protection Cabinet. The Cabinet does not discriminate on the basis of race, color, national origin, sex, age, religion, or disability and provides, on request, reasonable accommodations including auxiliary aids and services necessary to afford an individual with a disability an equal opportunity to participate in all services, programs, and activities.

CERTIFICATION

By the signatures below, the Kentucky Division for Air Quality certifies that the information contained in this Surveillance Network document for sampling year 2007 is complete and accurate at the time of submittal to EPA Region 4. However, due to circumstances that may arise during the sampling year, some network information may change. A notification of change and a request for approval will be submitted to EPA Region 4 at that time.

PUBLIC NOTIFICATION AND COMMENT PERIOD

In accordance with 40 C.F.R. 58.10(a)(1), the Kentucky Environmental and Public Protection Cabinet shall make the annual monitoring network plan available for public inspection for at least 30 days prior to submission to the U.S. EPA. The annual monitoring network plan details the operation and location of ambient air monitors operated by the Kentucky Division for Air Quality (KYDAQ), Louisville Metro Air Pollution Control District (LMAPCD), the National Park Service (NPS), and required industrial monitors.

A total of 684 hardcopy and 126 electronic notifications were mailed announcing the availability of the network plan for public inspection and comment. The public comment period relating to the 2007 annual monitoring network plan began March 19, 2007, and concluded at the close of business on April 18, 2007.

During the comment period, the LMAPCD and Tennessee Valley Authority (TVA) provided the KYDAQ with administrative corrections to the LMAPCD and TVA air monitoring network information through personal communication. Prior to the comment period, the NPS provided the KYDAQ with development plans for the Kentucky Trimodal Transpark (KTT) in Warren County. The KTT has the potential of becoming a large industrial and mobile transportation complex with a railroad hub and regional airport. The KTT will also have dedicated access to the I-65 and US 31-W corridors. Concern was expressed by the NPS over the loss of the NO_x monitor at the Oakland air monitoring station in Warren County because of the potential impact the KTT may have in the area. The KYDAQ considered the concerns expressed by the NPS prior to making a decision to discontinue the NO_x monitor in Warren County.

SLAMS – State and Local Air Monitoring Stations
SPM – Special Purpose Monitors
U.S.EPA – United States Environmental Protection Agency
UV – Ultra Violet
VOC – Volatile Organic Compounds

INTRODUCTION

In October 1975, the United State Environmental Protection Agency (U.S.EPA) established a work group to critically review and evaluate current air monitoring activities at that time. This group was named the Standing Air Monitoring Working Group (SAMWG). The review by the SAMWG indicated several areas where deficiencies existed which needed correction. The principal areas needing correction were: an excess of monitoring sites in some areas to assess air quality; existing regulations did not allow for flexibility to conduct special purpose monitoring studies; data reporting was untimely and incomplete caused by a lack of uniformity in station location and probe siting, sampling methodology, quality assurance practices, and data handling procedures.

In August 1978, recommendations developed by SAMWG, to remedy the deficiencies in the existing monitoring activities, were combined with the new requirements of Section 319 of the Clean Air Act. Section 319 provided for the development of uniform air quality monitoring criteria and methodology; reporting of a uniform air quality index in major urban areas; and the establishment of an air quality monitoring system nation-wide which utilizes uniform monitoring criteria and provides for monitoring stations in major urban areas that supplement State monitoring. The combination of the recommendations and requirements were included in a proposed revision to the air monitoring regulations.

In May 1979, air monitoring regulations were finalized by the U.S.EPA requiring certain modifications and additions to be included in the State Implementation Plan for air quality surveillance. These regulations require each state to operate a network of monitoring stations designated as State and Local Air Monitoring Stations (SLAMS) that measure ambient concentrations of air pollutants for which standards have been established. The SLAMS designation contains provisions concerning the conformity to specific siting and monitoring criteria not previously required. The regulations

also provide for an annual review of the monitoring network to insure objectives are being met and to identify needed modification.

The Kentucky Division for Air Quality (KYDAQ) has operated an air quality monitoring network in the Commonwealth since July 1967. The Louisville Metro Air Pollution Control District (LMAPCD), a local agency, has maintained a sub-network in its area of jurisdiction since January 1956. Since that time, the networks have been expanded in accordance with the U.S.EPA's regulations to consist of a current overall network of 44 stations, operated by KYDAQ, LMAPCD and the National Park Service. The Commonwealth's SLAMS air monitoring network monitors criteria pollutants for which the National Ambient Air Quality Standards (NAAQS) have been issued. In addition to a SLAMS network, KYDAQ's air monitoring network includes special purpose monitors (SPM) for air toxics, mercury, wet deposition and meteorological stations.

The annual monitoring network description, as provided for in 40 CFR Part 58.10, *Annual monitoring network plan and periodic network assessment*, must contain the following information for each monitoring station in the network:

1. The Air Quality System (AQS) site identification number for existing stations.
2. The location, including the street address and geographical coordinates, for each monitoring station.
3. The sampling and analysis method used for each measured parameter.
4. The operating schedule for each monitor.
5. Any proposal to remove or move a monitoring station within a period of eighteen months following the plan submittal.

6. The monitoring objective and spatial scale of representativeness for each monitor.
7. The identification of any site that is suitable for comparison against the PM2.5 NAAQS.
8. The Metropolitan Statistical Area (MSA), Core-Based Statistical Area (CBSA), Combined Statistical Area (CSA) or other area represented by the monitor.

The following document constitutes the Kentucky ambient air monitoring network description and is organized into three main parts:

- (1) Station Description Format: An outline of the designations, parameters, monitoring methods, and the basis for site selection.
- (2) Network Summaries: Presenting the total number of sites and monitors in each region and for the state. Also included is a listing of all proposed changes to the current network.
- (3) Air Monitoring Station Description: Each air monitor station is described in detail as per the outline in (1) above.

Modification to the network as determined by an annual review process will be made each year to maintain a current up-to-date network description document.

STATION DESCRIPTION FORMAT

AQS Site Identification Information

Pertinent, specific siting information for each site and monitor is stored in the U.S. EPA's AQS data system. This information includes the exact location of the site, local and regional population, description of the site location, monitor types, and monitoring objectives. This site and monitor information is routinely updated whenever there is a change in site characteristics or pollutants monitored.

Network Station Description

The network station descriptions contained in this document include the following information:

1. Site Description

Specific information is provided to show the location of the monitoring equipment at the site, if the site is located in a CSA/MSA, the AQS identification number, the GPS coordinates, and that monitors and monitor probes conform to the siting criteria.

2. Date Established

The date when each existing monitoring station was established is shown in the description. For those stations, which are proposed, a date is provided when it is expected for the station to be in operation.

3. Site Approval Status

Each monitoring station in the existing network has been reviewed with the purpose of determining whether it meets all design criteria for inclusion in the SLAMS network. Stations that do not meet the criteria will either be relocated in the immediate area or when possible, re-sited at the present location.

4. Monitoring Objectives

The monitoring network was designed to provide information to be used as a basis for the following actions:

- (a) To determine compliance with ambient air quality standards and to plan measures to attain these standards.
- (b) To activate emergency control procedures in the event of an impending air pollution episode.
- (c) To observe pollution trends throughout a region including rural areas and report progress made toward meeting ambient air quality standards.
- (d) To provide a database for the evaluation of the effects of air quality on population, land use, and transportation planning; to provide a database for the development and evaluation of air dispersion models.

5. Monitoring Stations' Designations

Most stations described in the air quality surveillance network are designated as "SLAMS". In addition, some of these stations fulfill other requirements, which must be identified. In this description of the network, designations are also made for National Air Monitoring Stations (NAMS), Special Purpose Monitors (SPM), Emergency Episode Monitoring sites and Air Quality Index sites (AQI). The following is the criteria used for each of these designations.

SLAMS: Requirements for air quality surveillance systems provide for the establishment of a network of monitoring stations designated as State and Local Air Monitoring Stations (SLAMS) that measure ambient concentrations of those pollutants for which standards have been established. These stations must meet

requirements that relate to four major areas: quality assurance, monitoring methodology, sampling interval and siting of instruments and instrument probes.

NAMS: Within the SLAMS network certain monitors are selected to provide the U.S. EPA with timely data for use in national trends analysis. These NAMS monitors are identified in the summary of network stations.

EMERGENCY EPISODE

MONITORING SITES (EPISODE):

Regulations provide for the operation of at least one continuous SLAMS monitor for each major pollutant in designated locations for emergency episode monitoring. These monitors are placed in areas of worst air quality and provide continual surveillance during episode conditions.

AIR QUALITY INDEX (AQI): Certain stations in the SLAMS network provide data for daily index reporting. Index reporting is required for all urban areas with a population exceeding 200,000. However, KYDAQ is providing this service to the general public from all areas where monitoring and attending staff are available. The AQI is a method of reporting that converts concentration levels of pollution to a simple number scale of 0-500. Intervals on the AQI scale are related to potential health effects of the daily measured concentrations of the major pollutants. KYDAQ prepares the Index twice daily for release to the public from the pollutant data reported from the Field Offices.

SPM: Not all monitors and monitoring stations in the air quality surveillance network are included in the SLAMS network. In order to allow the capability of providing monitoring for complaint studies, modeling verification and compliance status, certain monitors are

reserved for short-term studies and designated as Special Purpose Monitors (SPM). These monitors are not committed to any one location or for any specified time period. They may be located as separate monitoring stations or be included at SLAMS locations. Monitoring data may be reported, provided that the monitors and stations conform to all requirements of the SLAMS network.

6. Monitoring Methods

All sampling and analytical procedures used in the air-monitoring network conform to Federal reference (FRM), alternate (FAM) or equivalent (FEM) methods. In case there is no federal method, procedures are described in the Kentucky Air Quality Monitoring and Quality Assurance Manuals.

(a) Particulate Matter 10 microns in size (PM₁₀)

All PM₁₀ samplers operated by the Division for Air Quality are certified as either FRM or FEM samplers and are operated according to the requirements set forth in 40 CFR 50 and 40 CFR 53. Intermittent samplers collect a 24-hour sample every sixth day on 46.2 mm PTFE filters. The filter is weighed before and after the sample run. The gain in weight in relation to the volume of air sampled is calculated in micrograms per cubic meter ($\mu\text{g}/\text{m}^3$). The PTFE filters are to be equilibrated before each weighing for a minimum of 24 hours at a 20-23 degrees C mean temperature and a 30-40 % mean relative humidity.

Continuous PM₁₀ samplers provide 24-hour samples daily for SLAMS reporting. During sampling, ambient air passes through an inlet designed to pass only particles smaller than 10 microns in diameter. After exiting the inlet, the sample stream is sent to a mass

transducer. Inside the transducer the sample stream passes through a Teflon-coated glass fiber filter. This filter is weighed every two seconds. The difference between the current filter weight and the initial or installed weight gives the total mass of the collected particulate. The mass concentration is computed by dividing the total mass by the flow rate. Data is transmitted by telemetry for entry into the automated central data acquisition system.

(b) **Particulate Matter 2.5 microns in size (PM_{2.5})**

With the exception of continuous samplers all PM_{2.5} samplers operated by the Division for Air Quality are certified as either FRM or FEM samplers. All manual samplers are operated per the requirements set forth in 40 CFR 50, Appendix L. Samples are collected on 46.2mm PTFE filters over a 24-hour sampling period. Air flow through the filter is to be maintained at 16.7 liters per minute. The flow rate must not vary more than +/-5% for five minutes over a 24-hour sample period at actual ambient temperature and pressure. Samples must be retrieved within 177 hours of the end of the sample run and must be kept cool (4 degrees C or cooler) during transit to meet the thirty-day limit for re-weighing.

The PTFE filters are to be equilibrated before each weighing for a minimum of 24 hours at a controlled atmosphere of 20-23 degrees C mean temperature and 30-40% mean relative humidity. Filters must be used within thirty days of initial weighing. Filters must be re-weighed within thirty days of the end of the sample run and must be kept at 4 degrees C or cooler. The gain in weight in relation to the volume of air sampled is calculated in micrograms per cubic meter ($\mu\text{g}/\text{m}^3$).

Continuous PM_{2.5} samplers provide 24-hour samples daily for AQI reporting. During sampling, ambient air passes through an inlet and sharp cut cyclone designed to pass only particles smaller than 2.5 microns in diameter. After exiting the inlet, the sample stream is sent to a mass transducer. Inside the transducer the sample stream passes through a Teflon-coated glass fiber filter. This filter is weighed every two seconds. The difference between the current filter weight and the initial or installed weight gives the total mass of the collected particulate. The mass concentration is computed by dividing the total mass by the flow rate. Data is transmitted by telemetry for entry into the automated central data acquisition system.

(c) **PM_{2.5} Speciation sampling and analysis**

In addition to operating PM_{2.5} samplers that determine only PM_{2.5} mass values, KYDAQ also operates PM_{2.5} speciation samplers that collect samples that are analyzed to determine the chemical makeup of PM_{2.5}. Samples are collected on a set of three filters over a 24-hour sampling period. The individual filters are composed of different media in order to collect specific types of toxic pollutants.

After collection, the samples are shipped in ice chests to an EPA contract laboratory for analysis. At the laboratory the samples are analyzed using optical and electron microscopy, thermal optical analysis, ion chromatography and x-ray fluorescence to determine the presence and level of specific toxic compounds. Sample results are entered in the AQS data system.

(d) **Sulfur Dioxide**

Instruments used to continuously monitor sulfur dioxide levels in the atmosphere employ the UV fluorescence and UV open path methods. The continuous data output

from the instrument is transmitted by telemetry for entry into an automated central data system.

Calibration of these instruments is done dynamically using certified gas mixtures containing a known concentration of sulfur dioxide gas. This gas is then diluted in a specially designed apparatus to give varying known concentrations of sulfur dioxide. These known concentrations are supplied to the instruments, which are adjusted so that instrument output corresponds with the specific concentrations. Calibration curves are prepared for each instrument and each data point is automatically compared to this curve before entry into the data acquisition system.

(e) **Carbon Monoxide**

Continuous monitoring for carbon monoxide is performed by use of the non-dispersive infrared correlation method. Data is transmitted by telemetry for entry in an automated central data acquisition system.

Calibration of the instrument is performed periodically by using nitrogen or zero air to establish the zero baseline and NIST or NIST traceable gas mixtures of carbon monoxide in air. The span is checked daily using a certified mixture of compressed gas containing approximately 45 parts per million carbon monoxide.

(f) **Ozone**

Ozone is monitored using the UV photometry and UV open path methods. The continuous data output from the instrument is transmitted by telemetry for entry into an automated central data acquisition system.

Monitors are calibrated routinely using an ozone generator, which is calibrated using the ultra violet photometry reference

method. Calibration curves are prepared for each instrument and each data point is automatically compared to this curve before entry into the data acquisition system.

(g) **Nitrogen Dioxide**

The chemiluminescence and UV open path methods are used in monitoring the nitrogen dioxide level in the ambient air. The continuous data output from the instrument is transmitted by telemetry for entry into an automated central data acquisition system.

Calibration of these instruments is done dynamically using NIST certified gas mixtures of nitric oxide. Through the use of dilution apparatus, varying concentrations are produced and supplied to the monitors, thus producing a specific calibration curve for each instrument. Each data point is automatically compared to this curve before entry into the data acquisition system.

(h) **Lead**

Lead concentrations are determined from the analysis of suspended particulates collected by high volume particulate samplers. Particulate samples are ashed to remove organic matter and acid extracted to dissolve the metals. The lead content is determined by the atomic absorption spectroscopy method.

(i) **Mercury**

Cold vapor atomic fluorescence spectrometry is used to determine elemental gaseous mercury in ambient air at sub-ng/m³ levels. The analyzer uses a dual, ultra pure gold absorbent, cartridge design that allows alternating desorption and sampling. The dual cartridge designs results in continuous mercury sampling of the air stream. The continuous data

output from the instrument is transmitted by telemetry for entry into an automated central data acquisition system.

(j) **Air Toxics**

Air toxics pollutants are determined in three categories: metals, volatile organic compounds (VOC) and carbonyls.

Metal samples are collected on 46.2 mm PTFE filter over a 24-hour period similar to the PM10 monitoring method. The filter is weighed before and after the sample run. The gain in weight in relation to the volume of air sampled is used to calculate the concentration in micrograms per cubic meter ($\mu\text{g}/\text{m}^3$). The PTFE filter is to be equilibrated before each weighing for a minimum of 24 hours at a 20-23 degrees C mean temperature and a 30-40 % mean relative humidity. The filter is then delivered to the Division for Environmental Services for inductively coupled plasma/mass spectrometer analysis to determine the concentration of metals in $\mu\text{g}/\text{m}^3$.

VOC samples are collected in a vacuum canister. Ambient air is pulled into the canister over a 24-hour sampling period. The sample is shipped to the Division for Environmental Services for gas chromatography/mass spectrometer analysis. VOC concentrations determined in the sample are reported in $\mu\text{g}/\text{m}^3$.

Carbonyl samples are collected on a DPNH cartridge. An ambient air stream flows through the cartridge at a 1 liter per minute flow rate for a 24-hour sampling period. The cartridge is packed on ice and shipped to the Division for Environmental Services for high-pressure liquid chromatography analysis. Carbonyl concentrations determined in the sample are reported in $\mu\text{g}/\text{m}^3$.

(k) **Wet Deposition**

Acid precipitation monitoring stations operate on a weekly sampling schedule. Cumulative precipitation events occurring during a seven-day period are collected in one container to represent a one-week sample. An Aerochem precipitation sampler and NCON samplers are used to collect the sample. The principle of operation of the samplers is based on the use of a moisture sensor that activates an electrically driven movable container lid covering the “wet” container during dry periods and then is moved to un-cover the “wet” container when precipitation occurs. The opening and closing of the lid for each precipitation event is indicated on a data logger providing the time and date of each event. At the end of each weekly sampling period, the sample bag/bottle in the “wet” container is removed and a new sample bag/bottle is installed. The sample is then analyzed at the Division for Environmental Services’ laboratory.

7. Quality Assurance Status

The Division for Air Quality has an extensive quality assurance program to ensure that all air monitoring data collected is accurate and precise. Staff members audit air monitors on a scheduled basis, including those operated by the Louisville Metro Air Pollution Control District, to ensure that each instrument is calibrated and operating properly. Data validation is performed monthly by verifying the data reported by each instrument is recorded accurately in the computerized database.

8. Area Representativeness

Each station in the monitoring network must be described in terms of the physical dimensions of the air parcel nearest the monitoring station throughout which actual pollutant concentrations are

reasonably similar. Area dimensions or scales of representativeness used in the network description are:

- (a) Microscale - defines the concentration in air volumes associated with area dimensions ranging from several meters up to about 100 meters.
- (b) Middle scale - defines the concentration typical of areas up to several city blocks in size with dimensions ranging from about 100 meters to 0.5 kilometers.
- (c) Neighborhood scale - defines concentrations within an extended area of a city that has relatively uniform land use with dimensions in the 0.5 to 4.0 kilometers.
- (d) Urban scale - defines an overall citywide condition with dimensions on the order of 4 to 50 kilometers.
- (e) Regional Scale - defines air quality levels over areas having dimensions of 50 to hundreds of kilometers.

Closely associated with the area around the monitoring station where pollutant concentrations are reasonably similar are the basic monitoring exposures of the station. There are four basic exposures included in this description:

- (a) To determine the highest concentrations expected to occur in the area covered by the network.
- (b) To determine representative concentrations in areas of high population density.
- (c) To determine the impact on ambient pollution levels of significant sources or source categories.

- (d) To determine general background concentration levels.

The design intent in siting stations is to correctly match the area dimensions represented by the sample of monitored air with the area dimensions most appropriate for the monitoring objective of the station. The following relationship of the four basic objectives and the area of representativeness are appropriate when siting monitoring stations:

<u>Monitoring Exposures</u>	<u>Siting Area Scale</u>
Highest concentration	Micro, Middle, Neighborhood
Population	Neighborhood, Urban
Source impact	Micro, Middle, Neighborhood
General/background	Neighborhood, Regional

Data Processing and Reporting

All ambient air quality data are stored in a centralized server located at the 14th floor of the Capital Plaza Tower, the Environmental and Public Protection (EPPC) headquarters in Frankfort, Kentucky. The server is backed up on tape nightly, weekly and monthly. The backup tape of the server is stored off site of the EPPC headquarters and is cycled through use on a monthly schedule. After each month of data has passed all quality assurance checks, the data is transmitted via telemetry to the U.S. EPA's national data storage system known as AQS. Statistical data summaries are generated from this database and compiled to produce the Ambient Air Quality Annual Report. This report may be accessed at the KYDAQ website: <http://www.air.ky.gov>. The report is located under **Public Information**.

SUMMARY OF NETWORK CHANGES 2007

Ashland-Huntington Region – Grayson Lake (21-043-0500) add Hg wet deposition sampler.

Bluegrass Region – Ironworks (21-067-0001) discontinue site. **Nicholasville** (21-113-0001) add Hg wet deposition and sulfur dioxide samplers.

Cincinnati-Northern Kentucky Region – Covington (21-117-0007) when the NKU site is operational, discontinue sulfur dioxide and nitrogen dioxide samplers. **East Bend** (21-015-0003) when the NKU site is operational, discontinue mercury sampler. **NKU** (to be announced) add sulfur dioxide, nitrogen dioxide, mercury, Hg wet deposition, PM_{2.5}, PM_{2.5} TEOM and ozone samplers.

Owensboro Region – Baskett (21-101-0014) discontinue PM₁₀ TEOM sampler; add PM_{2.5} TEOM sampler. **Echols** (21-183-0032) discontinue air toxics sampling; discontinue ozone and sulfur dioxide point source samplers; add Hg wet deposition sampler; sample nitrogen dioxide, ozone and sulfur dioxide pollutants with the UV open path method.

North Central Region – Shepherdsville (21-029-0006) discontinue PM₁₀ TEOM, nitrogen dioxide, and PM_{2.5} TEOM samplers. **Elizabethtown** (21-093-0006) add PM_{2.5} TEOM sampler.

Paducah Region – Bloodworth (21-139-0004) discontinue mercury and sulfur dioxide samplers. **Smithland** (21-139-0003) add mercury and Hg wet deposition samplers.

South Central Region – Oakland (21-227-0008) discontinue nitrogen dioxide sampler add PM_{2.5} samplers. **Bowling Green** (21-227-0007) discontinue PM_{2.5} samplers.

- (t) Continuous PM Monitor

(Rev.3/27/06)

401 KAR 50:020 Air Quality Control Region: Appalachian Intrastate (101)
CSA/MSA: Middlesborough, KY Micropolitan Statistical Area
Site Name: Middlesboro
AQS Site ID: 21-013-0002
Location: Middlesboro Airport, Middlesboro, KY 40965
County: Bell
GPS Coordinates: 36.608056, -83.736944
Date Established: February 14, 1992
Inspection Date: November 28, 2006
Inspection By: Andrea P. Keatley
Site Approval Status: Site and monitors meet all design criteria for the monitoring network.

The monitoring site is a stationary equipment shelter located on the grounds of the Middlesboro Airport in Middlesboro, Kentucky. The sample inlets are 13 feet above ground level and 55 feet from the nearest road. The most recent site inspection was conducted on November 28, 2006. Upon inspection the sample lines and monitors were found to be in good condition. Even though this site is for special purpose monitoring, the site meets the requirements of 40 CFR 58, Appendices C, D and E.

Monitoring Objective:

The monitoring objectives are to determine compliance with National Ambient Air Quality Standards and to provide information on the transport of ozone into the region.

Monitors:

Monitor Type	Designation	Analysis Method	Frequency of Sampling
FRM PM _{2.5}	SPM	Gravimetric	24-hours every sixth day
AEM Ozone	SPM	UV photometry	Continuously March 1-October 31
Meteorological	Other	AQM grade instruments for wind speed, wind direction, humidity, barometric pressure and temperature	Continuously

Quality Assurance Status:

All Quality Assurance procedures have been implemented in accordance with 40 CFR 58, Appendix A.

Area Representativeness:

The site represents population exposure on a neighborhood scale for particulates. This site also represents transport on a regional scale for ozone.

Particulate Neighborhood Scale

Ozone Regional Scale

401 KAR 50:020 Air Quality Control Region: Appalachian Intrastate (101)

CSA/MSA: Not in a MSA – Rural

Site Name: Hazard

AQS Site ID: 21-193-0003

Location: Perry County Horse Park, Hazard, KY 41701

County: Perry

GPS Coordinates: 37.283056, -83.220278

Date Established: April 1, 2000

Inspection Date: October 24, 2006

Inspection By: Andrea P. Keatley

Site Approval Status: Site and monitors meet all design criteria for the monitoring network.

The monitoring site is a stationary equipment shelter located on the grounds of the Perry County Horse Park in Hazard, Kentucky. The sample inlets are 15 feet above ground level and 65 feet from the nearest road. The most recent site inspection was conducted on October 24, 2006. Upon inspection the sample lines and monitors were found to be in good condition. This site meets the requirements of 40 CFR 58, Appendices C, D and E.

Monitoring Objective:

The monitoring objectives are to determine compliance with National Ambient Air Quality Standards; to detect elevated pollutant levels for activation of emergency control procedures for ozone; and to measure rural concentrations of a sub-group of air toxics for use in national assessment.

Monitors:

Monitor Type	Designation	Analysis Method	Frequency of Sampling
AEM Ozone	SPM EPISODE	UV photometry	Continuously March 1 – October 31
FRM PM ₁₀	SLAMS	Gravimetric	24-hours every sixth day
- Collocated PM ₁₀	SLAMS	Gravimetric	24-hours every sixth day
- Metals PM ₁₀	SPM	Determined from the PM ₁₀ sample using EPA method IO 3.4	Same as PM ₁₀

County: Pike

GPS Coordinates: 37.482778, -82.535278

Date Established: May1, 1994

Inspection Date: September 12, 2006 and March 8, 2007

Inspection By: Andrea P. Keatley

Site Approval Status: Site and monitors meet all design criteria for the monitoring network.

The monitoring site is a stationary equipment shelter located behind the DOT District Office building at 101 North Mayo Trail in Pikeville, KY. The sample inlets are 12 feet above ground level and 116 feet from the nearest road. A new stationary shelter was delivered to the Pikeville site in December 2006. Upon inspection the sample lines and monitors were found to be in good condition. This site meets the requirements of 40 CFR 58, Appendices C, D, E and G.

Monitoring Objective:

The monitoring objectives are to determine compliance with National Ambient Air Quality Standards; to detect elevated pollutant levels for activation of emergency control procedures for particulates; and to provide pollutant levels for daily air quality index reporting.

Monitors:

Monitor Type	Designation	Analysis Method	Frequency of Sampling
AEM Ozone	SPM AQI	UV photometry	Continuously March 1 – October 31
FRM PM _{2.5}	SLAMS	Gravimetric	24-hours every third day
- Collocated FRM PM _{2.5}	SLAMS	Gravimetric	24-hours every sixth day
PM _{2.5} TEOM	SPM AQI	Tapered element oscillating microbalance, gravimetric	Continuously

Quality Assurance Status:

All Quality Assurance procedures have been implemented in accordance with 40 CFR 58, Appendix A.

Area Representativeness:

The site represents population exposure on a neighborhood scale for particulates. This site also represents population exposure on an urban scale for ozone.

Date Established: January 4, 1973

Inspection Date: September 22, 2006

Inspection By: Andrea P. Keatley

Site Approval Status: Site and monitors meet all design criteria for the monitoring network.

The monitoring site is a stationary equipment shelter located on the grounds of the Bates Elementary School in Louisville, Kentucky. The sample inlets are 13 feet above ground level and 1000 feet from the nearest road. The most recent site inspection was conducted on September 22, 2006. The air monitoring site was found to be in accordance with 40 CFR Part 58, Appendices C, D, E and G.

Monitoring Objective:

The monitoring objectives are to determine compliance with National Ambient Air Quality Standards and to provide pollution levels for daily index reporting.

Monitors:

Monitor Type	Designation	Analysis Method	Frequency of Sampling
AEM Ozone	SLAMS AQI	UV photometry	Continuously March 1 – October 31
PM _{2.5} TEOM	Other AQI	Tapered element oscillating microbalance, gravimetric	Continuously

Quality Assurance Status:

All Quality Assurance procedures have been implemented in accordance with 40 CFR Part 58, Appendix A.

Area Representativeness:

The site represents population exposure on an urban scale for ozone. This site also represents population exposure on a neighborhood scale for fine particulates.

Area Representativeness:

This site represents maximum concentration on an urban scale for ozone. This site also represents population exposure on a neighborhood scale for particulates and sulfur dioxide.

401 KAR 50:020 Air Quality Control Region: Evansville-Owensboro-Henderson Interstate (077)

CSA/MSA: Not in a MSA - Rural

Site Name: Echols

AQS Site ID: 21-183-0032

Location: Keytown Road, Echols, KY 42320

County: Ohio

GPS Coordinates: 37.319725, -86.956097

Date Established: February 1, 2005

Inspection Date: September 19, 2006

Inspection By: Andrea P. Keatley

Site Approval Status: Site and monitors meet all design criteria for the monitoring network.

The monitoring site is a stationary equipment shelter located on farmland off Keytown Road near the intersection with Pond Church Road in Echols, Kentucky. The sample inlets are 12 feet above ground level and 100 feet from the nearest road. The most recent site inspection was conducted on September 19, 2006. Upon inspection, the sample lines and monitors were found to be in good condition. The site meets the requirements of 40 CFR 58, Appendices C, D and E.

Monitoring Objective:

The monitoring objective is to determine compliance with National Ambient Air Quality Standards.

Monitors:

Monitor Type	Designation	Analysis Method	Frequency of Sampling
Nitrogen Dioxide	SPM	UV open path	Continuously
Ozone	SPM	UV open path	Continuously March 1 – October 31
FRM PM ₁₀	SPM	Gravimetric	24-hours every sixth day
- Metals PM ₁₀	SPM	Determined from the PM ₁₀ samples using EPA method IO 3.4	Same as PM ₁₀
FRM PM _{2.5}	SPM	Gravimetric	24-hours every sixth day
PM _{2.5} TEOM	SPM	Tapered element oscillating microbalance, gravimetric	Continuously
Sulfur Dioxide	SPM	UV open path	Continuously
Mercury – ambient	SPM	Cold vapour atomic fluorescence spectrometry	Continuously
Mercury – Wet Deposition	SPM	Wet deposition collected, analysis of sample by the Environmental Services Laboratory	Weekly
Ammonia	SPM	UV open path	Continuously
Nitric Oxide	SPM	UV open path	Continuously

Meteorological	Other	AQM grade instruments for wind speed, wind direction, humidity, barometric pressure and temperature	Continuously
----------------	-------	---	--------------

Quality Assurance Status:

All Quality Assurance procedures have been implemented in accordance with 40 CFR 58, Appendix A for the FRM PM_{2.5} and PM₁₀ monitors. Quality Assurance procedures are currently being developed for the open path methods.

Area Representativeness:

This site represents source oriented exposure on an urban scale.
